

# DozerNet — Client Clarification Questions

Compiled from the Proposal Report and current implementation, to remove unstated assumptions before further development. Please answer every question below.

## CRITICAL

Blocks correctness of behavior that is already built or in progress. Please answer these first.

### Stated Assumptions (Proposal Report, Section 8.3) — please confirm or replace each

- **Q1.** The proposal assumes 'administrators enter and review all booking, machine, operator, maintenance, invoice, and payment information carefully.' Is manual admin diligence sufficient, or should the system add automated validation/cross-checks for these entries?
- **Q2.** The proposal assumes 'private owners and independent drivers provide genuine information and valid documents.' Is manual admin verification of uploaded NIC/licence documents sufficient, or is a third-party verification step (e.g. government ID API) expected?
- **Q3.** The proposal assumes 'a machine marked available is not under an unrecorded booking or maintenance restriction.' What system checks (beyond admin diligence) should guarantee this, given the system does not use live GPS tracking?
- **Q4.** The proposal assumes 'customers provide correct contact details so status messages can reach them.' If a notification cannot reach a customer, is any fallback required (e.g. flag the account, block further bookings until contact info is verified)?

### Pricing Model

- **Q5.** The system currently uses a flat daily-rate pricing strategy (days × daily rate). Is this final, or are machine-type-specific rates, seasonal/peak pricing, a minimum booking duration, or district-based surcharges required?

### Cancellation & Refund Policy

- **Q6.** What are the exact rules for cancelling a 'pending' or 'unpaid-approved' booking — is there a deadline/cutoff before the hire date, and are partial refunds or penalty fees applied if a booking is cancelled after payment?

### Payment Simulation

- **Q7.** Is the demo card payment portal purely a UI simulation (any input accepted), or must it validate card details (number format/Luhn check, expiry date)?
- **Q8.** How should partial payments be tracked and completed — is a due-balance reminder or follow-up notification required?

### Booking Conflict Rules

- **Q9.** Can one customer submit a single request covering multiple machines, and can a single machine be booked for two different time slots on the same day, or is conflict checking strictly per full day?

### Outstanding Grading Deliverable

- **Q10.** The module specification requires a separate Design Document (Use Case Diagram, Class Diagram, one Activity Diagram per major function, Ethical Considerations, Agile sprint summary) for the Week 10 Progress Evaluation. Is producing this document in scope for this engagement, and if so by what date?

## IMPORTANT

Needed for consistent, complete feature behavior across modules.

### Fleet & Categories

- **Q11.** What is the definitive list of job categories / machine types customers should be able to browse and filter by?
- **Q12.** Are machine photos required for every catalogue listing, and who supplies them — admin only, or can private owners upload their own?

### Locations

- **Q13.** Should the district selector cover all 25 Sri Lankan districts, or only a specific subset the business currently serves?

### Identity & Verification

- **Q14.** Should NIC registration accept both the old format (9 digits + V/X) and the new 12-digit format, or only one?

### Operators

- **Q15.** Should operator assignment (after payment) be a manual admin pick from the verified pool, or should the system auto-suggest an available/nearest operator?
- **Q16.** Are independent drivers paid through the platform (commission/split tracked in the system), or paid directly by the customer/owner outside the system?

### Private Owners

- **Q17.** Does DozerNet take a commission/fee on private-owner bookings, or does it purely facilitate the booking with no revenue share modeled?

### Maintenance

- **Q18.** Should maintenance scheduling be purely admin-initiated, or should the system support usage-based or interval-based maintenance triggers (e.g. every N operating hours/days)?

### Notifications

- **Q19.** Is in-app notification sufficient for this build, or should the 'demo email log' be formatted/styled as a realistic email (branding, content expectations)?

### Reporting

- **Q20.** Which specific admin reports are required (e.g. revenue by period, fleet utilization, booking counts), and should they be viewable on-screen, exportable (CSV/PDF), or both?

### Accounts

- **Q21.** Can the same person hold multiple roles — e.g. be both a customer and a private JCB owner — under one account, or must roles be strictly separate accounts?

### **Invoicing**

- **Q22.** Should invoices include VAT or any tax line, or is flat Rs. pricing with no tax calculation sufficient?

## **NICE-TO-CLARIFY**

Polish and scope edges — useful to know but do not block core functionality.

### **Localization & Accessibility**

- **Q23.** Is English-only sufficient, or is Sinhala/Tamil language support expected?
- **Q24.** Is there a specific accessibility standard/level (e.g. WCAG 2.1 AA) the system should target, beyond general 'ease of use for non-technical users'?

### **Security Details**

- **Q25.** Beyond BCrypt password hashing, are there specific session-timeout or password-complexity policy requirements?

### **Booking Window**

- **Q26.** Is there a minimum or maximum advance-booking window (e.g. no same-day bookings, no bookings more than 90 days in advance)?

### **Invoice Numbering**

- **Q27.** Does invoice numbering need to follow a specific format/sequence for audit purposes, or is an internal auto-increment ID acceptable?

Total questions: 27. Please provide answers inline or as a numbered list referencing Q1–Q27.
